	ethylamine (ethanamine)	diethylamine (N-ethyl ethanamine)	Trimethylamine (N,N-dimethyl methanamine)	tetramethylammonium chloride

NOT AMINES

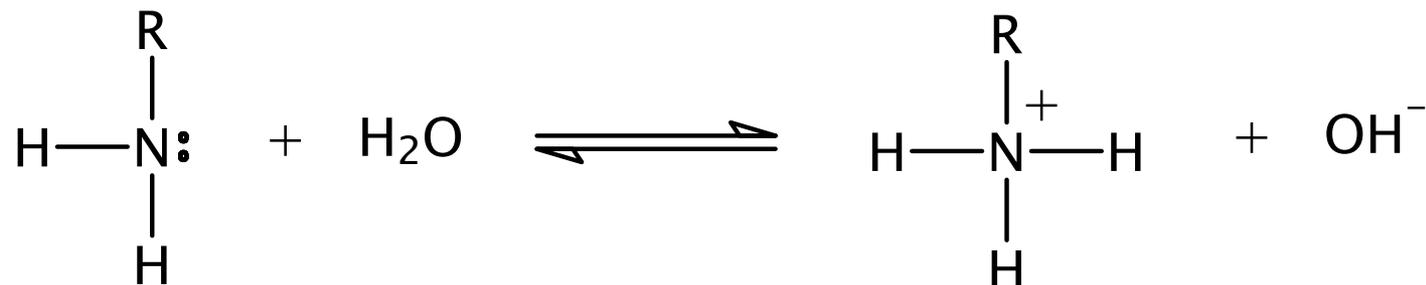

TYPES OF AMINES

- There is some H-bonding between 1^y and 2^y amines.
- Quaternary ammonium salts are **not** amines.
- Aromatic amines have the N joined to the benzene ring, e.g. phenylamine.

BASE STRENGTH OF AMINES

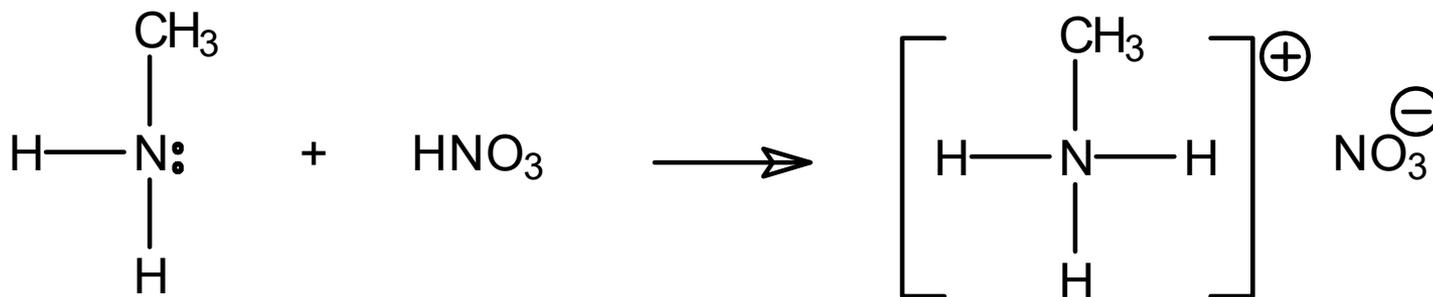

- Amines are weak bases.
- Lone pair on N can accept a proton.

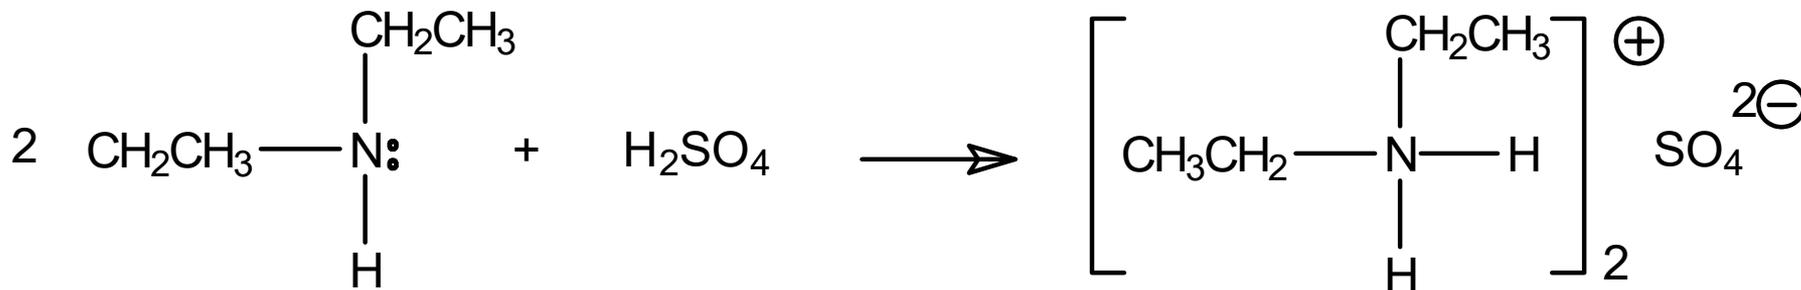

BASE STRENGTH OF AMINES

methylamine + nitric acid

TASK 1

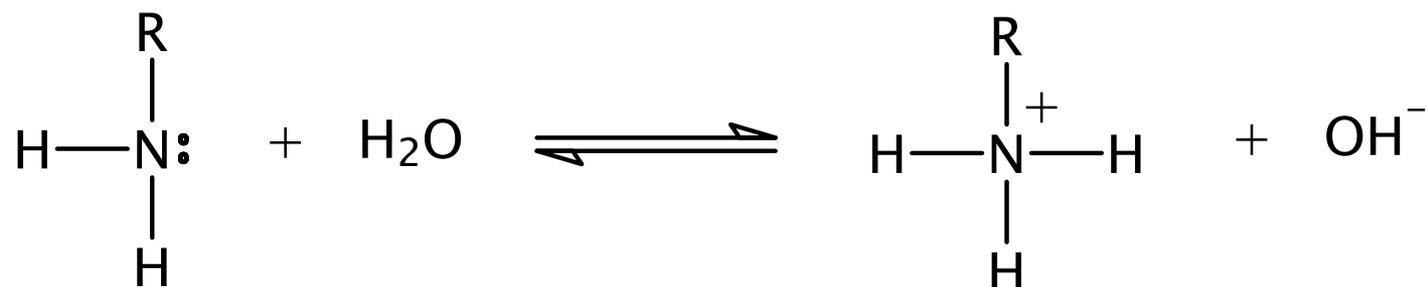

diethylamine + sulfuric acid

BASE STRENGTH OF AMINES

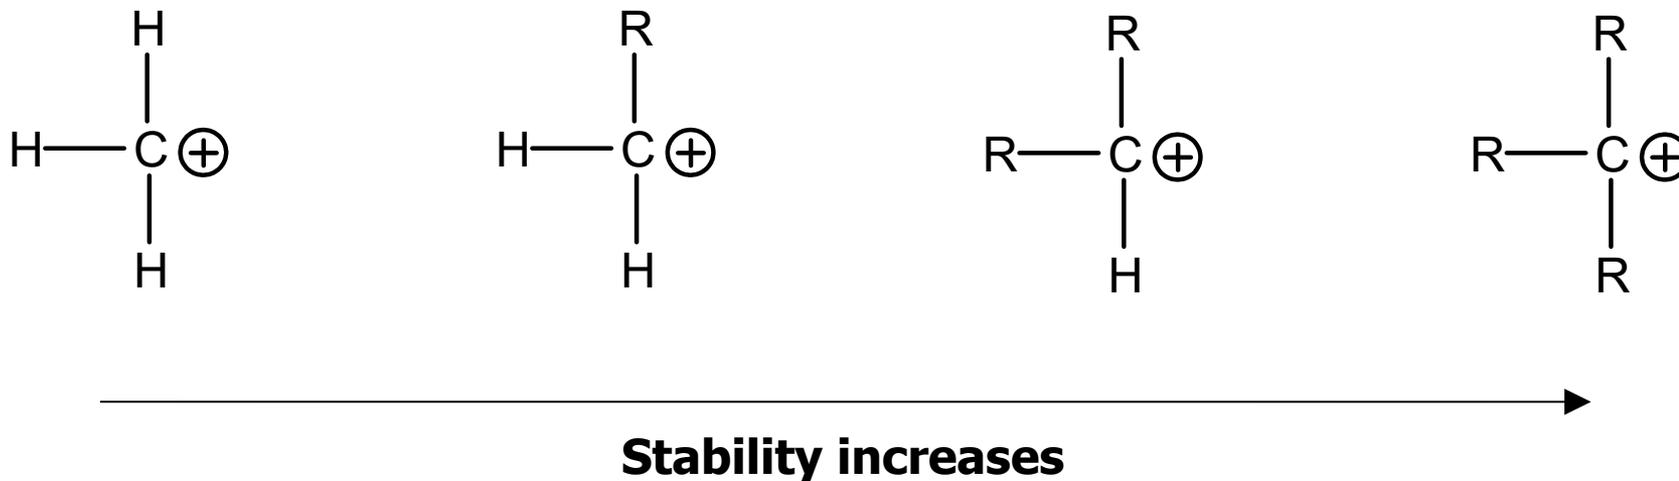

- Amines are weak bases.
- Lone pair on N can accept a proton.

- Base strength depends on how well **N lone pair** can accept H^+ .
- The higher the electron density of the **N lone pair**, the stronger the base.

BASE STRENGTH OF AMINES

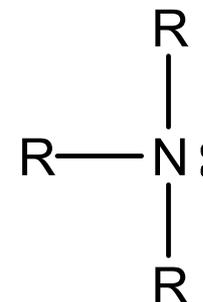

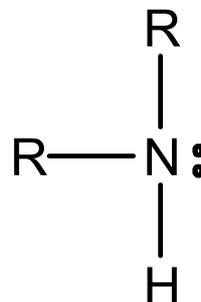

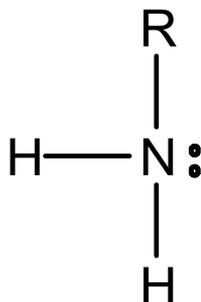

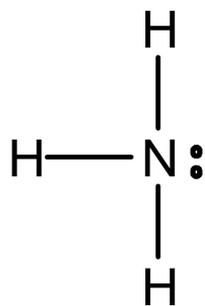

- Alkyl groups push electrons towards the N better than H (remember carbocation stability).

- INDUCTIVE EFFECT** of alkyl groups pushing away electron density more than H atoms

BASE STRENGTH OF AMINES

- The more alkyl groups, the greater the inductive effect pushing electron density onto the N lone pair

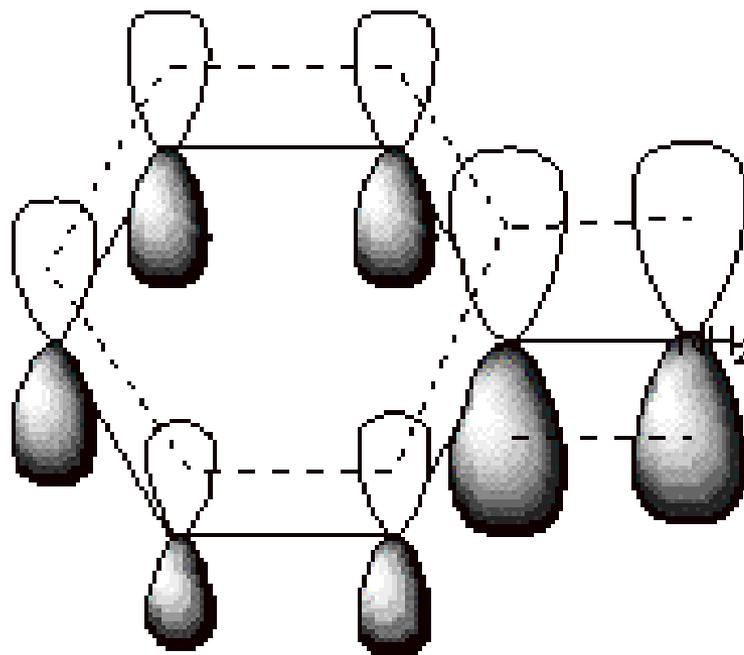

Base strength increases

BASE STRENGTH OF AMINES

- In aromatic amines, the N lone pair is partially delocalised into the benzene ring, lowering the electron density on N lone pair, lowering the base strength.

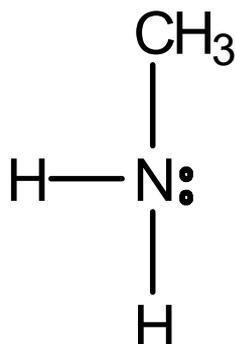

$3^y > 2^y > 1^y > \text{NH}_3 > \text{aromatic}$

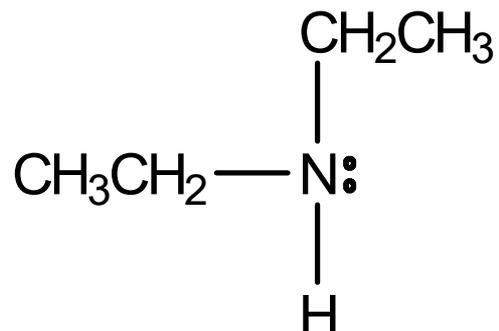

BASE STRENGTH OF AMINES

TASK 2

methylamine

diethylamine

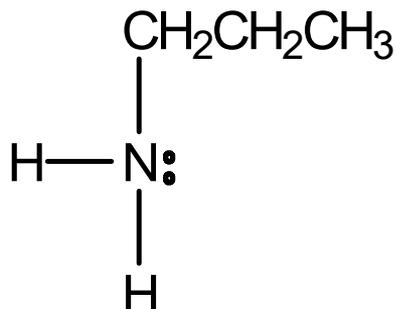

Stronger base = diethylamine

- 2^o compared to 1^o
- Extra inductive effect of two alkyl groups compared to one
- Diethylamine has greater electron density on N lone pair
- Diethylamine has greater ability to accept H⁺

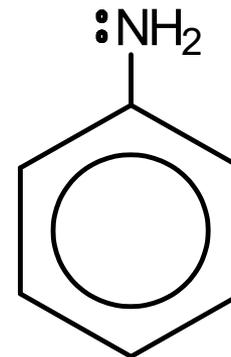

BASE STRENGTH OF AMINES

TASK 2

propylamine

phenylamine

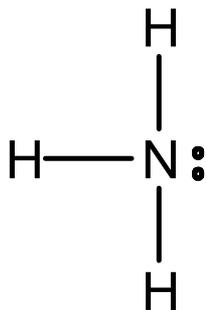

Stronger base = propylamine

- Lone pair on phenylamine N is partially delocalised into benzene ring
- Propylamine has greater electron density on N lone pair
- Propylamine has greater ability to accept H⁺

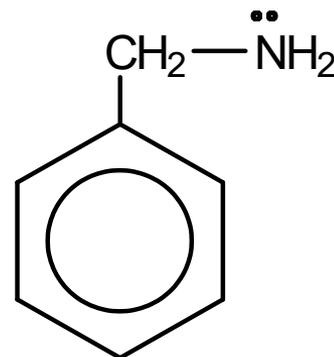

BASE STRENGTH OF AMINES

TASK 2

ammonia

phenylmethanamine

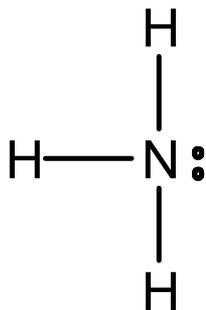

Stronger base = phenylmethanamine

- 1^o compared to ammonia
- Inductive effect of an alkyl group compared to H
- Phenylmethanamine has greater electron density on N lone pair
- Phenylmethanamine has greater ability to accept H⁺

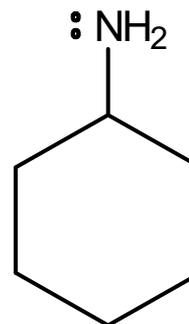

BASE STRENGTH OF AMINES

TASK 2

ammonia

cyclohexylamine

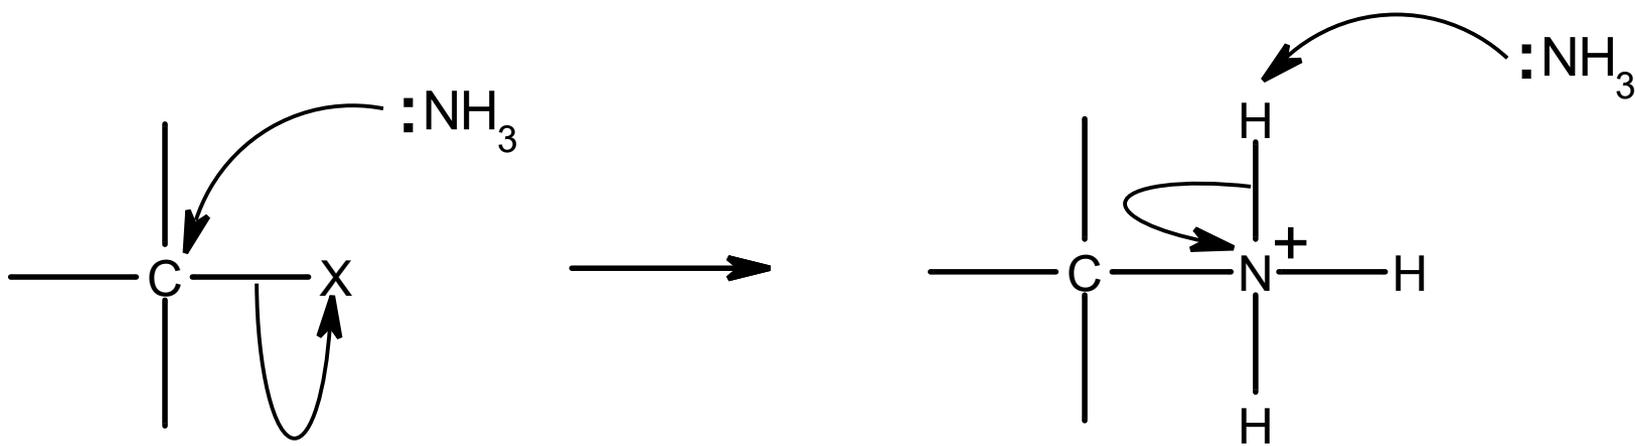

Stronger base = cyclohexylamine

- 1^o compared to ammonia
- Inductive effect of an alkyl group compared to H
- Cyclohexylamine has greater electron density on N lone pair
- Cyclohexylamine has greater ability to accept H⁺

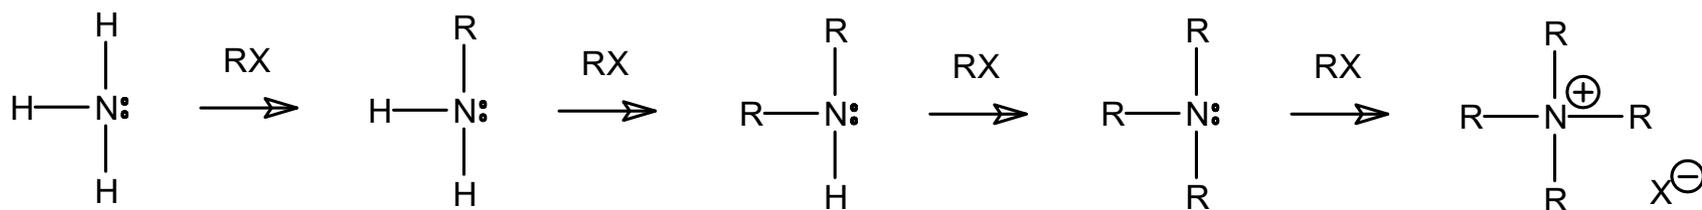

NUCLEOPHILIC SUBSTITUTION

- Lone pair on N can attack $\delta+$ C of haloalkane.

NUCLEOPHILIC SUBSTITUTION

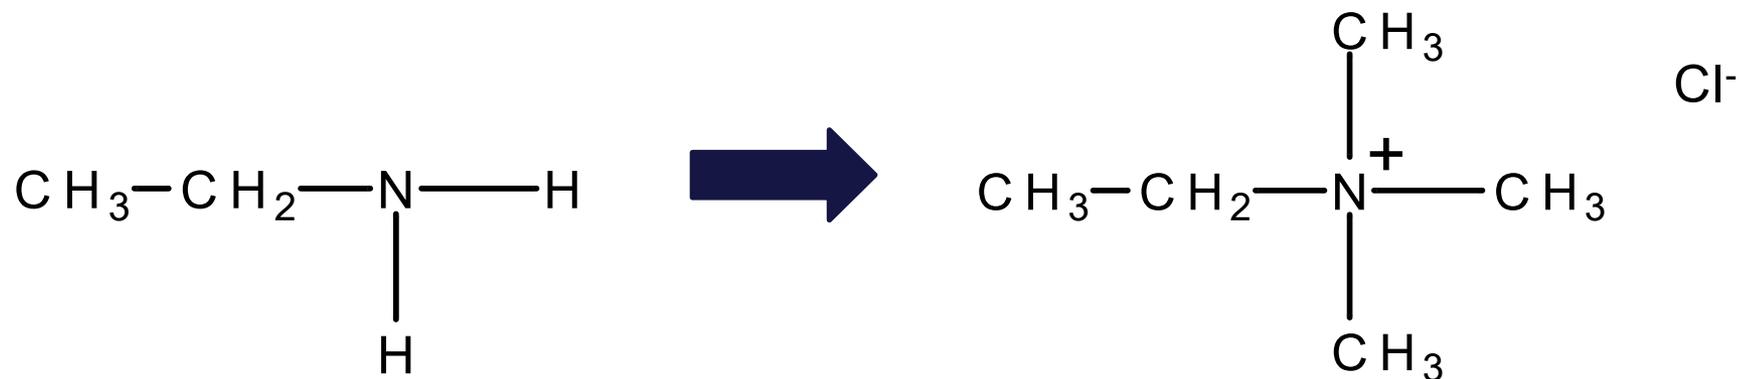

- H on N is swapped by R from haloalkane.
- Product also has lone pair on N so product reacts further.

- To get mainly 1^y amine use XS NH_3 .
- To get mainly 4^y ammonium salt use XS RX .

NUCLEOPHILIC SUBSTITUTION

ethylamine + XS chloromethane

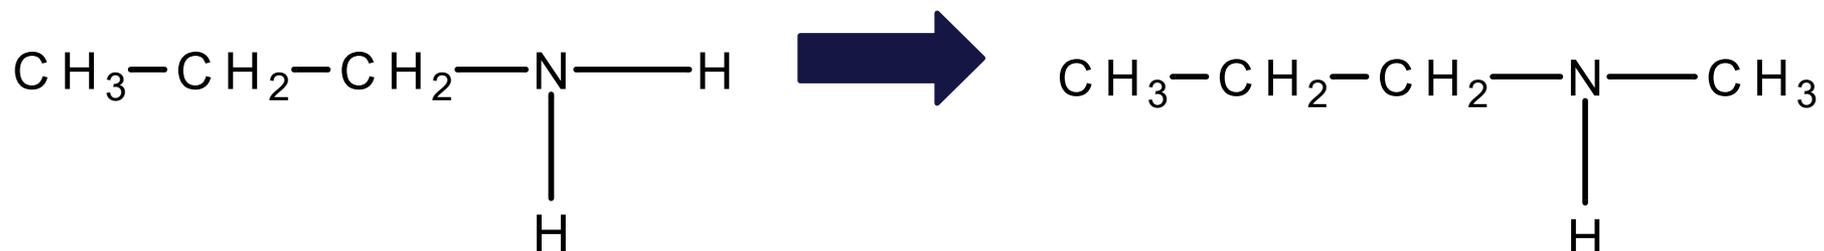

ethyltrimethylammonium
chloride

TASK 3
Q1

NUCLEOPHILIC SUBSTITUTION

XS propylamine + chloromethane

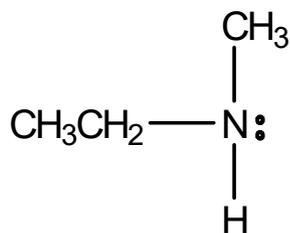

N-methylpropylamine
OR
(N-methyl propan-1-amine)

TASK 3
Q2

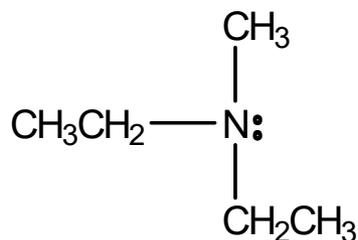

NUCLEOPHILIC SUBSTITUTION

methylamine + chloroethane

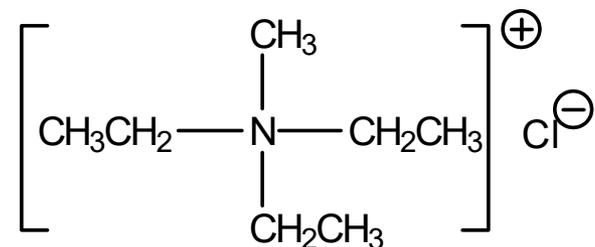

(products & 1st mechanism)

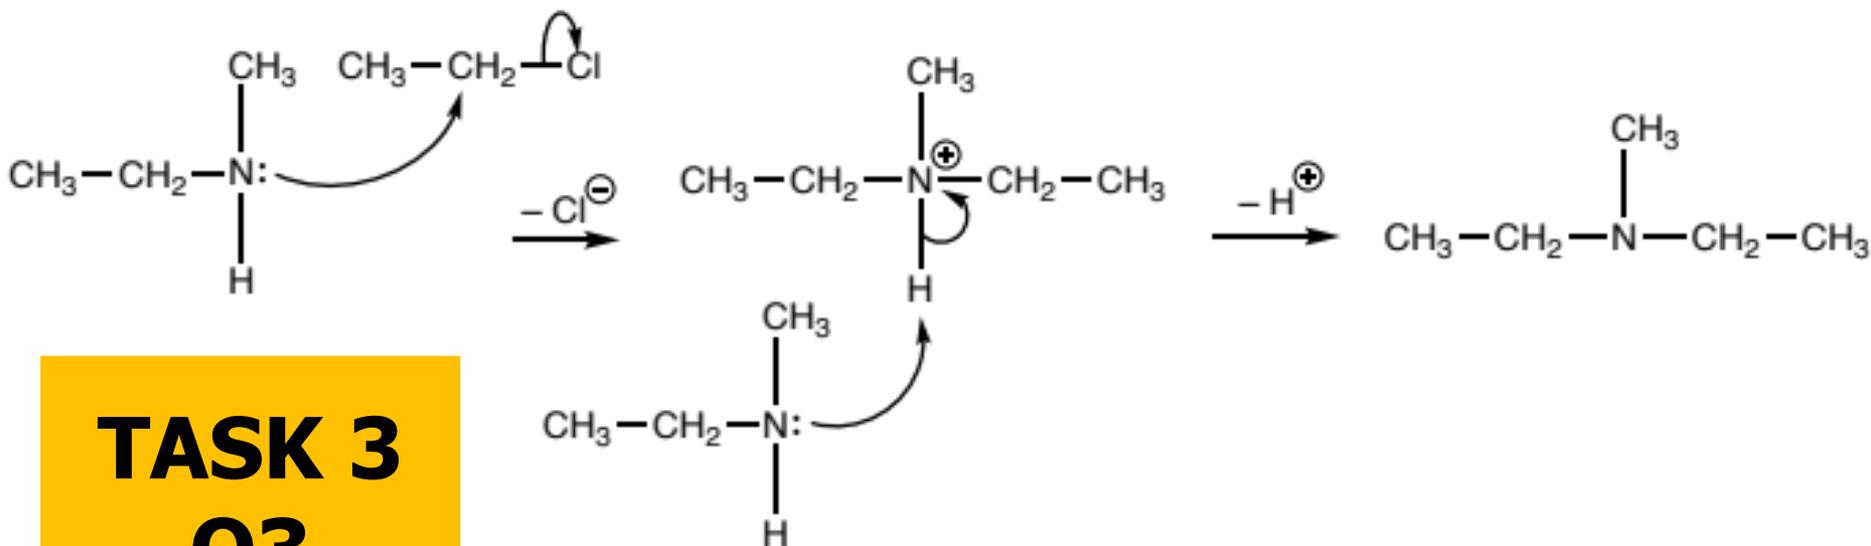

N-methylethylamine
or
N-methyl ethanamide

N-methyldiethylamine
or
N-ethyl N-methyl ethanamide

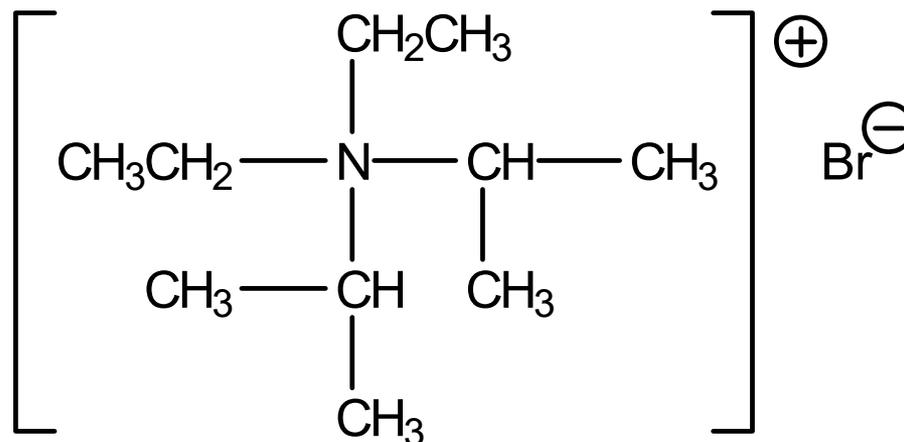

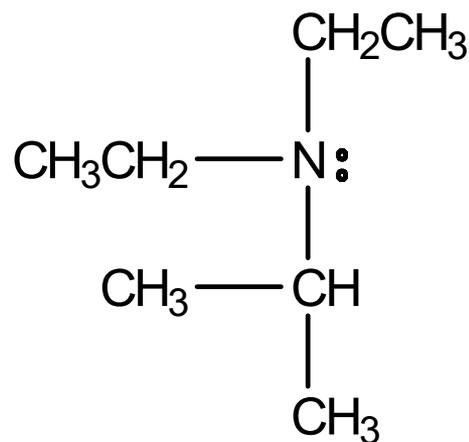

N-methytriethylammonium
chloride

TASK 3
Q3

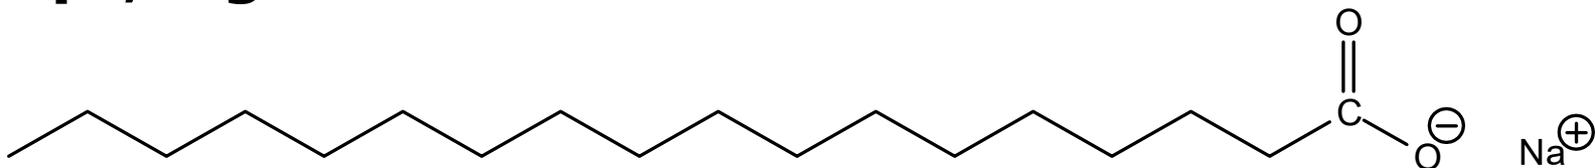

NUCLEOPHILIC SUBSTITUTION

diethylamine + 2-bromopropane (products)

TASK 3
Q4

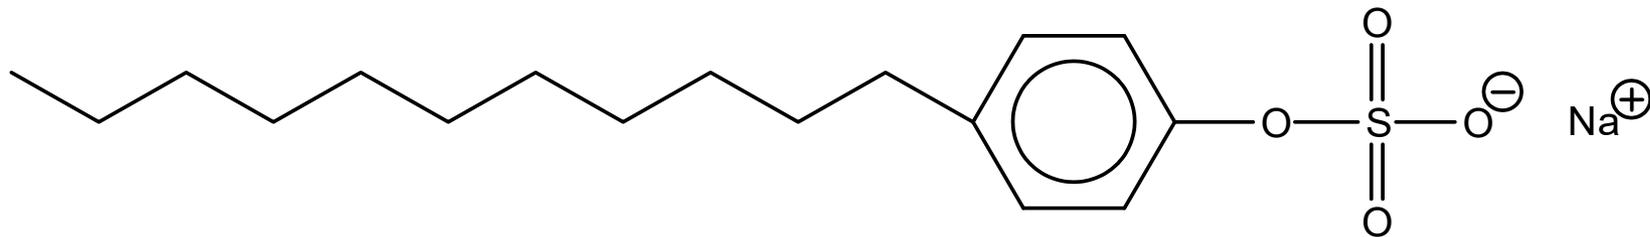

Soaps, e.g.

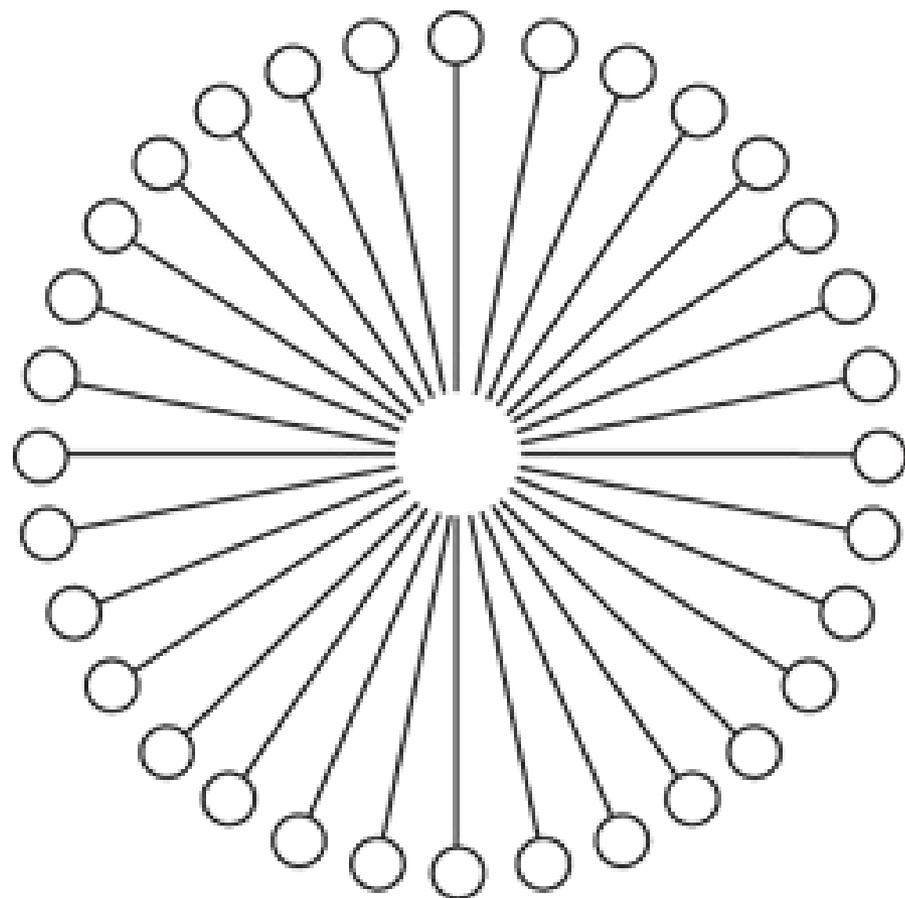

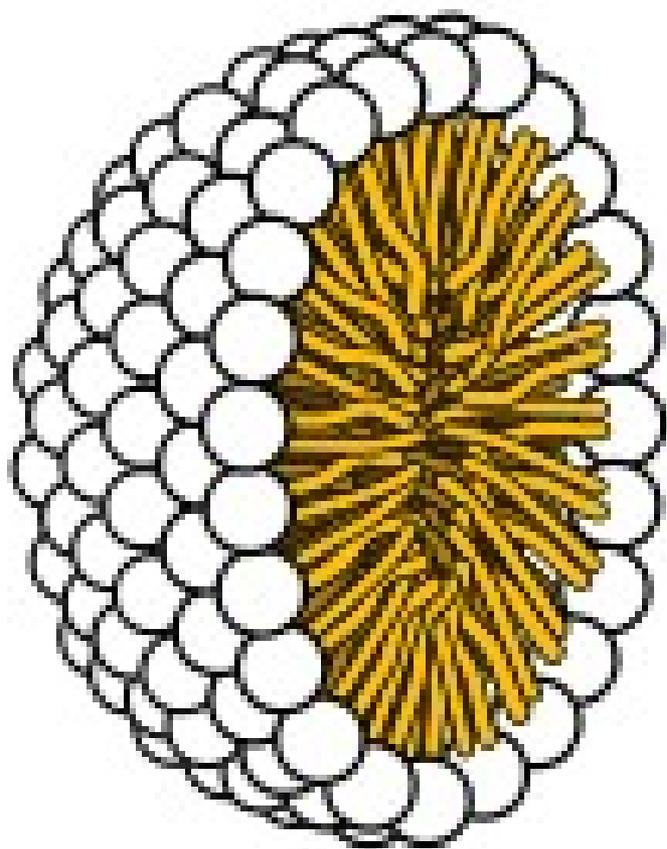

long alkyl tail
(hydrophobic)
dissolves grease

ionic head
(hydrophilic)
dissolves in water

Detergents, e.g.

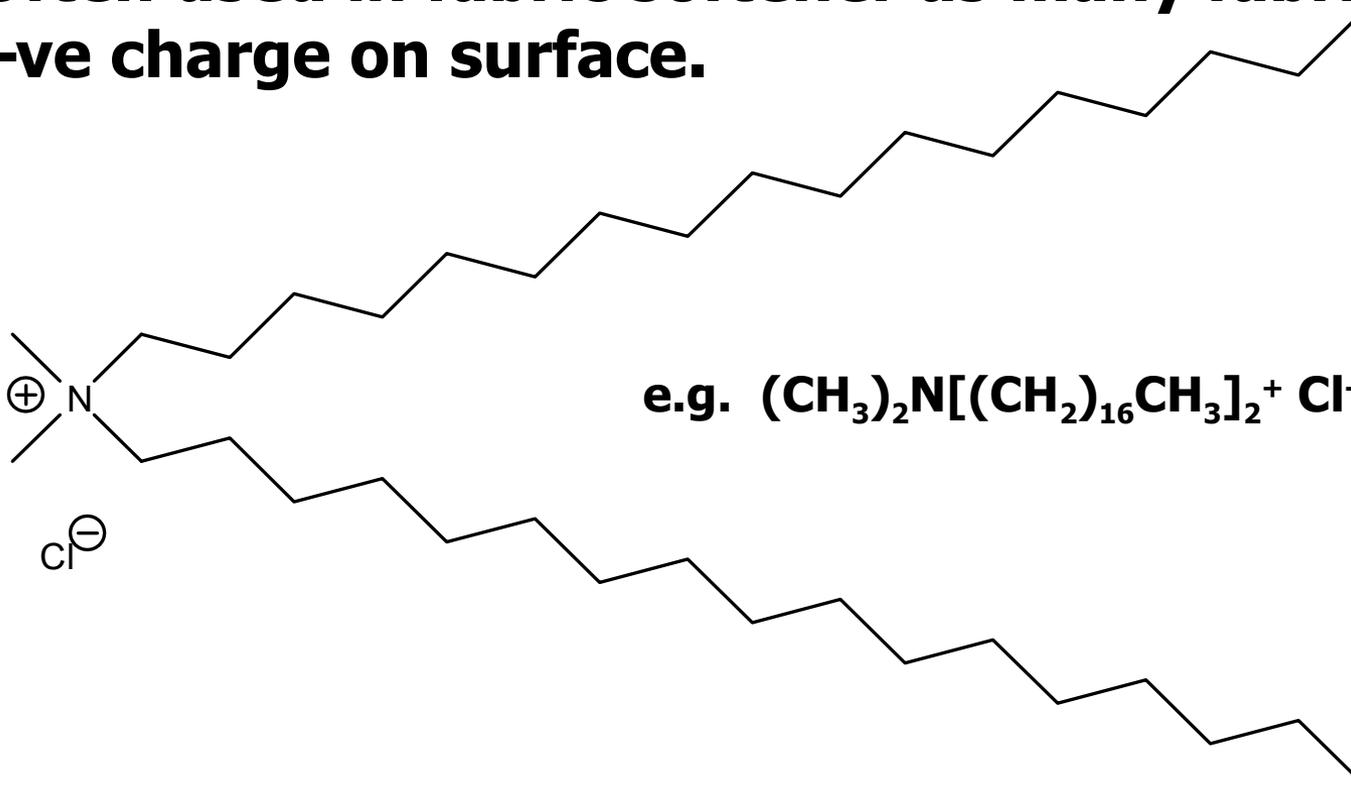

Micelle

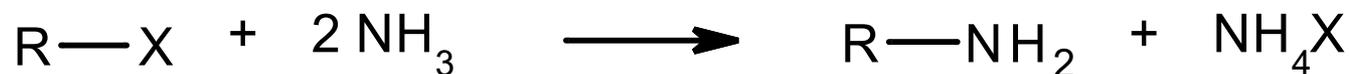

4^y ammonium salts

- **Ones with some long chain alkyl groups can be used as cationic surfactants.**
- **Often used in fabric softener as many fabrics have –ve charge on surface.**

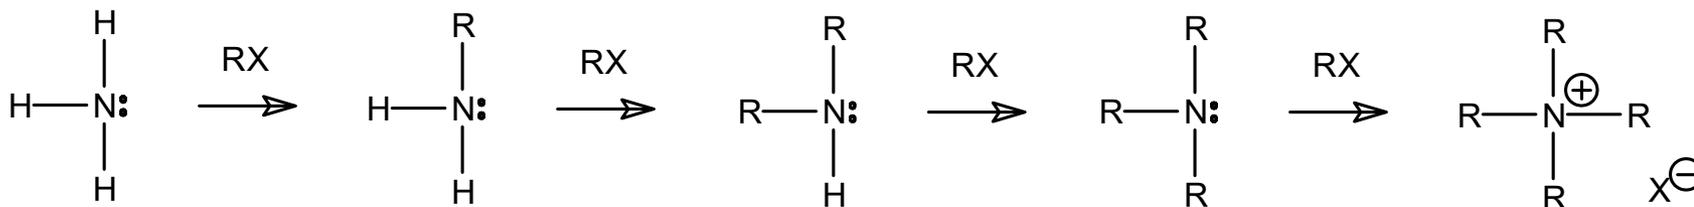

MAKING ALIPHATIC 1^y AMINES

1 – Reaction of NH₃ with halogenoalkanes

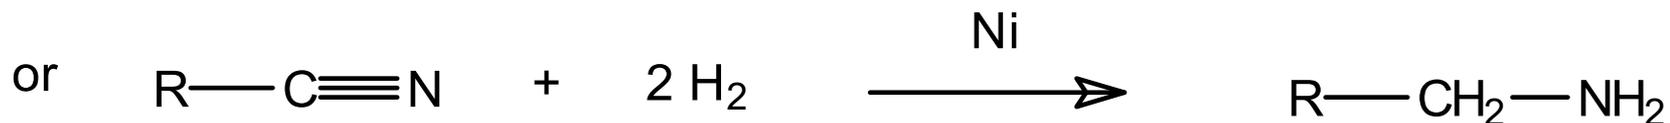

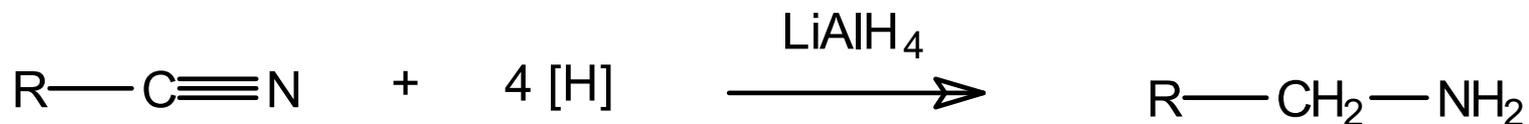

- **Products under further substitution**
- **Get a mixture of products so method rarely used**

MAKING ALIPHATIC 1^y AMINES

2 – Reduction of nitrile compounds

- **Preferred method – only one amine formed**

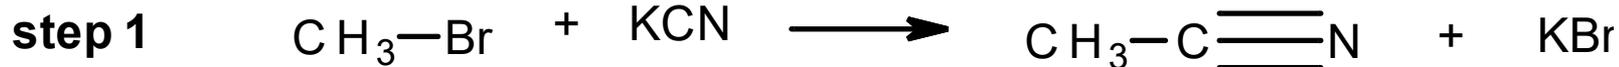

MAKING ALIPHATIC 1^y AMINES

e.g. ethylamine

route 1

route 2

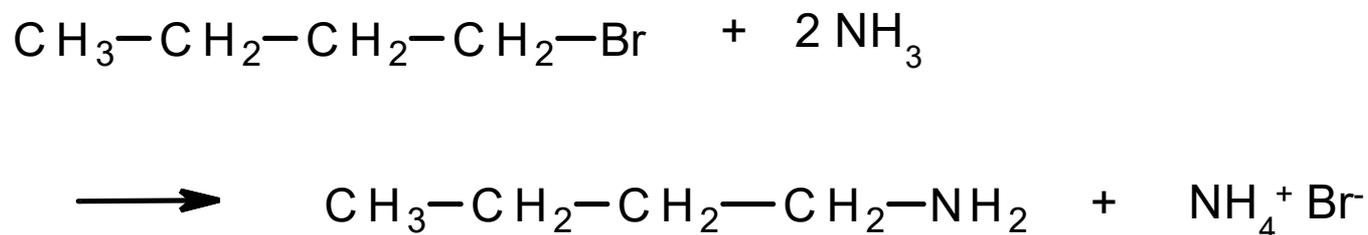

MAKING ALIPHATIC 1^y AMINES

TASK 4

e.g. butylamine

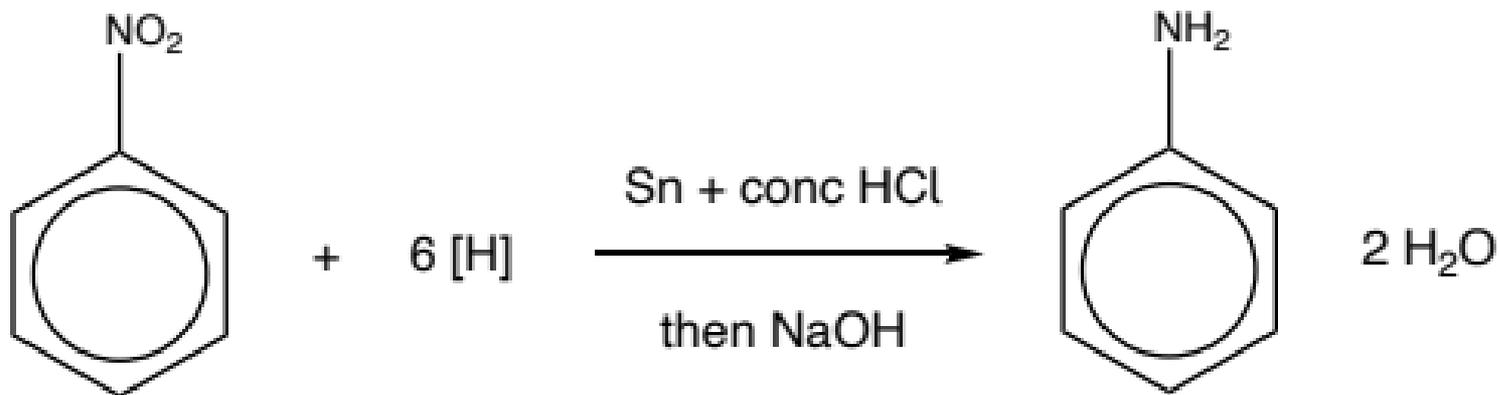

route 1

route 2

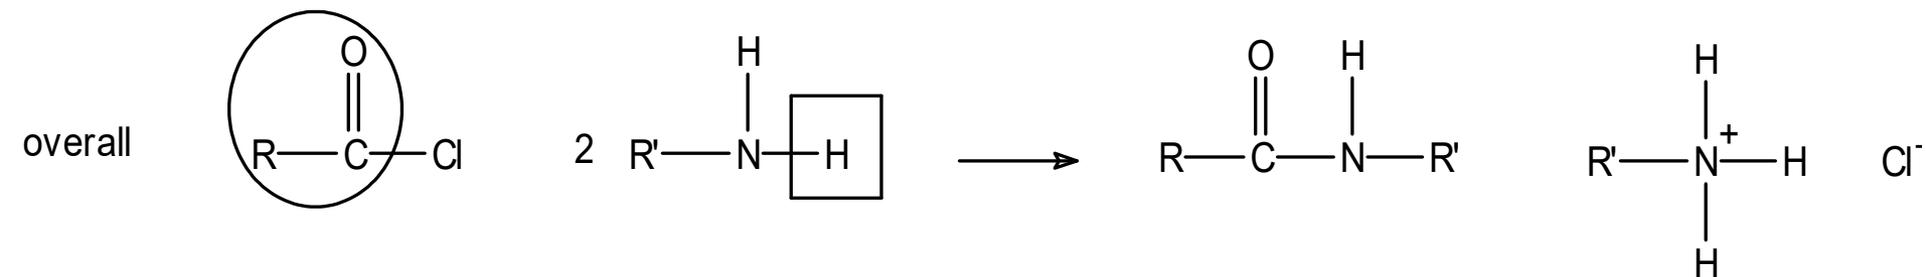

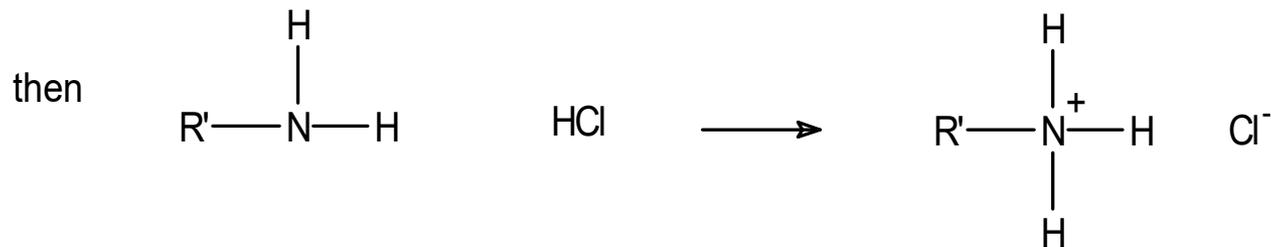

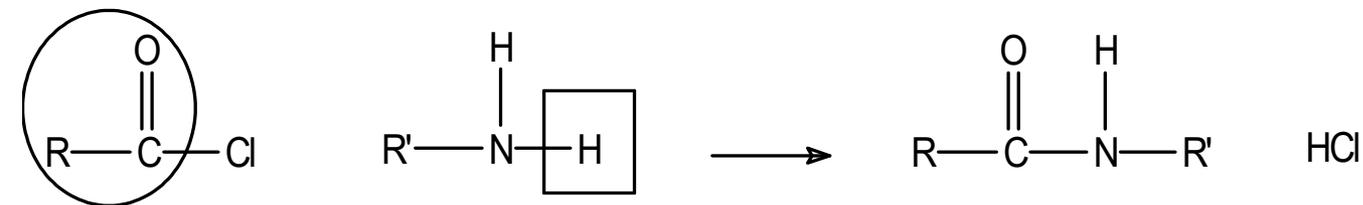

MAKING AROMATIC AMINES

ACYLATION

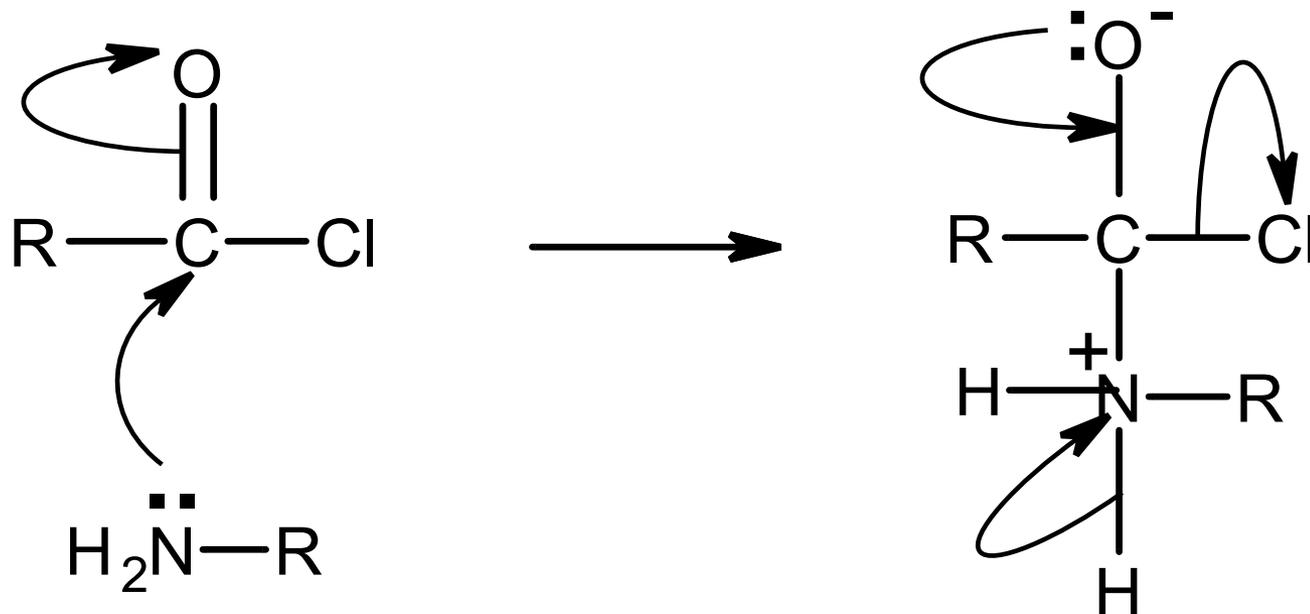

Acylation = replacing an H with an acyl group

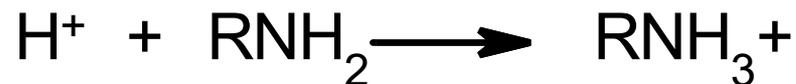

ACYLATION

Nucleophilic addition-elimination

amines & ammonia

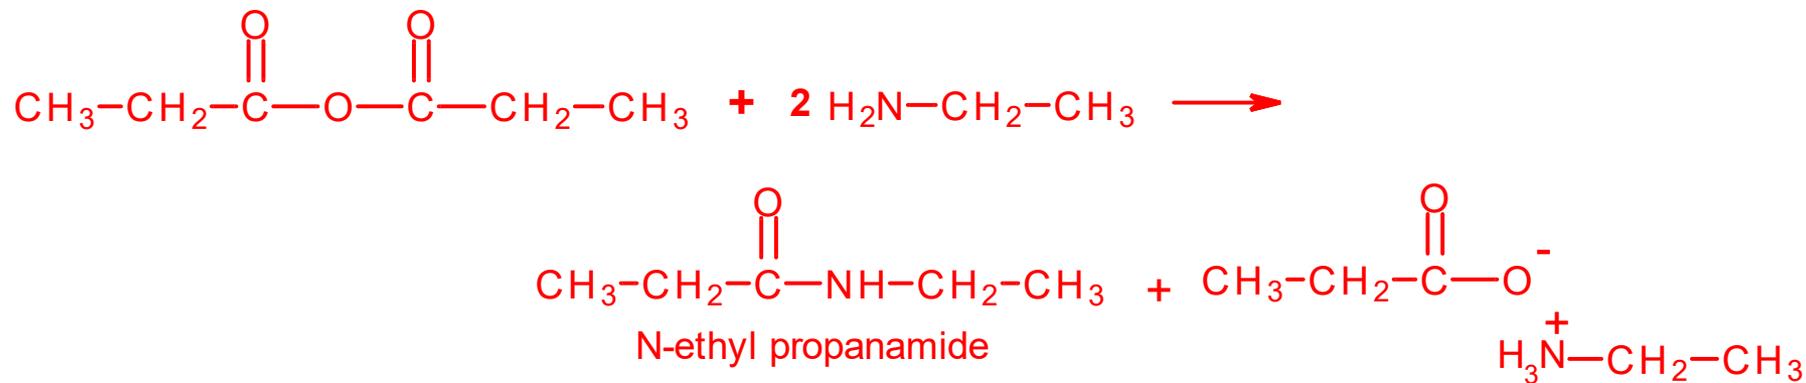

then

ACYLATION

Acylation = replacing an H with an acyl group

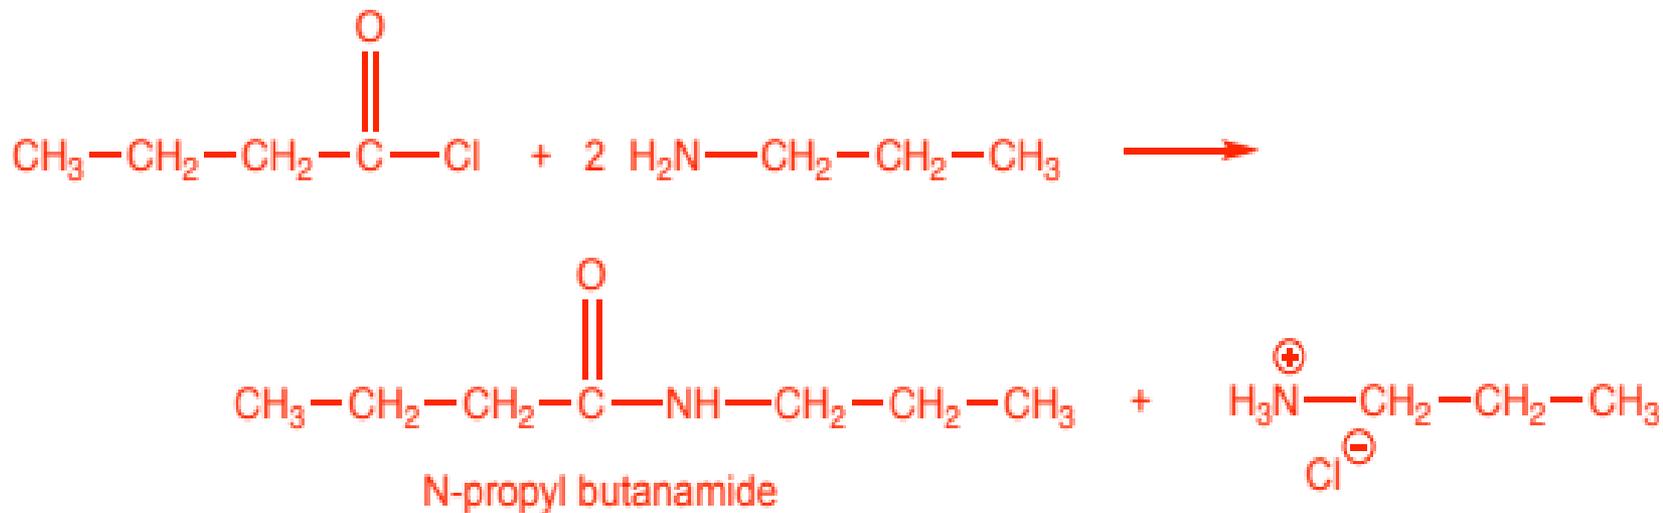

e.g. ethylamine + propanoic anhydride

ACYLATION

Acylation = replacing an H with an acyl group

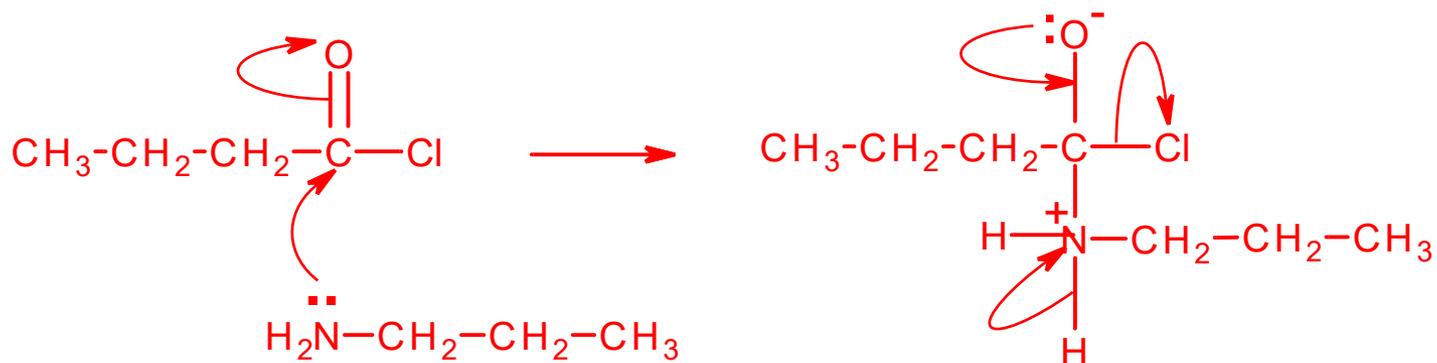

e.g. propylamine + butanoyl chloride

ACYLATION

Nucleophilic addition-elimination

e.g. propylamine + butanoyl chloride

then
